

Git Clone Repository

Setup to run the code.

(Folder structure)

1. create tables using in postgres using
 - 1.1 code-challenge-template\src\create_tables.sql
2. Install all libraries in python environment
 - 2.1 command : pip install -r code-challenge-template\src\requirements.txt
3. update database credential in **code-challenge-template\src\ingest_data\utility.py**
 - 3.1 Replace all 5 parameters in def get_connections()

```
def get_coonection():

    con = psycopg2.connect(
        database="postgres",
        user="your_user",
        password="your_password",
        host="localhost",
        port= '5432'
    )
    return con
```

Save the file

4. Run Python script

Command prompt : python yourpath\code-challenge-template\src\ingest_data\ingest_data.py

Example:

```
C:\Users\I...>python D:\python_visual_studio\wx_data\code-challenge-template\src\ingest_data\ingest_data.py
Start Time : 1678663790.6582243

insert yeild data

Total row inserted for yeild data  0
insert weather data
Total row inserted for weather data  0

End Time : 1678663820.432345

Total execution time : %s seconds 29.774120569229126
```

5. Run code-challenge-template\src\insert_data_in_aggregate.sql

5.1 Inserts data in **aggregated_wx_data** table

5.2 Contain select query to get aggregated data from **wx_data_table**

6. update database credential in **code-challenge-template\src\fetch_data\utility.py**

6.1 Replace all 5 parameters in def get_connections()

```
def get_coonection():

    con = psycopg2.connect(
        database="postgres",
        user="your_user",
        password="your_password",
        host="localhost",
        port= '5432'
    )
    return con
```

Save the file

7. Open new command prompt and change working dir to

7.1 Code-challenge-template\src\fetch_data

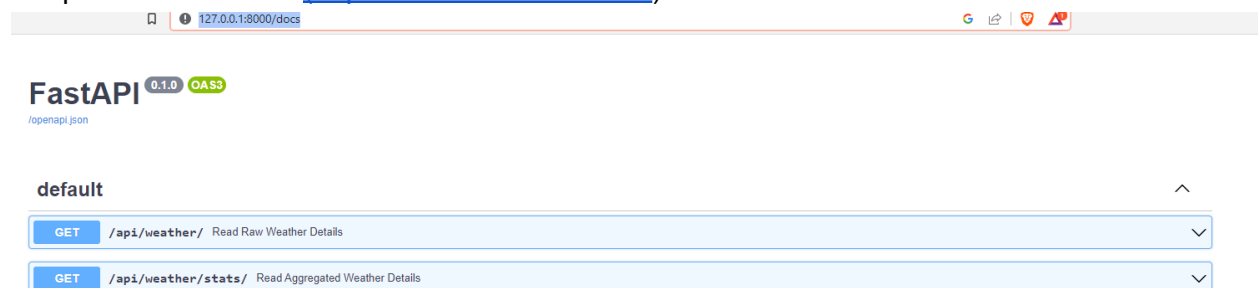

7.2 run **uvicorn main:app --reload** to start Application server

Example:

```
D:\>cd D:\..._studio\wx_data\code-challenge-template\src\fetch_data

D:\..._studio\wx_data\code-challenge-template\src\fetch_data>uvicorn main:app --reload
+32mINFO+0m: Will watch for changes in these directories: ['D:\..._studio\wx_data\code-challenge-template\src\fetch_data']
+32mINFO+0m: Uvicorn running on http://127.0.0.1:8000 (Press CTRL+C to quit)
+32mINFO+0m: Started reloader process [126356] using WatchFiles
```

8. Open url in browser (<http://127.0.0.1:8000/docs>)

9. Test the endpoints

9.1 /app/weather/

default

GET /api/weather/ Read Raw Weather Details

Parameters

Cancel

Name	Description
skip integer (query)	<input type="text" value="0"/>
limit integer (query)	<input type="text" value="10"/>
filter_date string (query)	<input type="text" value="filter_date"/>
station_id string (query)	<input type="text" value="station_id"/>

Execute

Clear

Responses

Curl

```
curl -X 'GET' \
  http://127.0.0.1:8000/api/weather/?skip=0&limit=10 \
  -H 'accept: application/json'
```

Request URL

```
http://127.0.0.1:8000/api/weather/?skip=0&limit=10
```
